

The Moon

The following 10 statements all contain factual errors.

Listen to David Rothery talking about the moon and correct the errors. Then check your corrections against the key on @eapguru.

1. Our moon is the only moon that doesn't have a particular colour
2. It's not just the moon that causes bubbles in the Earth's oceans.
3. Pieces of the moon sometimes move around.
4. As everybody knows, the moon has a dark side.
5. It was the discovery of the moons of Jupiter that first demonstrated that not all motion in the universe goes around the Sun.
6. Only planets can have moons.
7. Most moons orbit in the same direction that their planet is orbiting.
8. Saturn's moon **Io** is the most volcanically active body in the solar system.
9. Some moons are so cold that the ice on the surface behaves just like ice from the fridge.
10. Moons such as Jupiter's Europa are some of the more likely places where water could be found.
